                         02-AUG-2001
The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and theraphylaxis and treatment of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a companylaxis and treatment of pathological conditions resulting from a companylaxis and treatment of pathological conditions resulting from a companient infection, for evaluating a compound, such as a polypeptide, components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of pseudomonas species using biochip technology. Sequences or other sequences of Pseudomonas species using biochip technology. Sequence absorbance and sequence data for this patent did not form part of the printed specification but, was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; immunosuppressive; antiarthritic; antirheumatic; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; opthalmalogical; vulnerary; secreted protein; rhematoid arthritis; hyperproliferative disorder; cardiovascular disorder; cardiac arrest; cerebrovascular disorder; Alzheimer's disease; infection; ocular disorder; wound healing; epithelial cell proliferation; skin ageing; food additive; preservative; antiproliferative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   92 TIGRGPDNDWVLPDPERLVSSRHCTILNRDGVYYLTDTSTNGVLLVNAGHRLRRGNSEPL 151

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (EILSA) Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac carest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac carest, cerebrovascular disorders e.g. cardiac corest, careforous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, bacteria, viruses and fungi and ocular disorders e.g. corneal infection, can also be used to aid wound healing and epithelial cell proliferation, cor regenerate tissues not chemotaxis. The polypeptides can also be used can also be used to content, lipid, protein, carbohydrate, vitamins, cor expensitities, fat content, lipid, protein, carbohydrate, vitamins, mineralls, cofactors and other nutritional components. The present capabilities and other nutritional components. The present sequence represents a novel secreted protein of the invention. Note: The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 WTFGRNPACDYHLGNISRLSNKHFQIL--XXXXXXLLNDISTNGTWLNGQKVEKNSNQLL 58

ROSEN C A. RUBEN S M. BARASH S C. (ROSE/) R (RUBE/) R (BARA/) B Barash SC; Rosen CA, Ruben SM,

WPI; 2003-147444/14. N-PSDB; ABX73184. New polypeptides and nucleic acids, useful in gene therapy for treating, inhibiting or preventing e.g. neural, immune system, muscular, respiratory, reproductive, gastrointestinal, pulmonary, cardiovascular or renal disorders.

Claim 11; SEQ ID NO 809; 402pp; English.

The invention relates to human novel polypeptides and their associated polymuclectides. The polypeptides and polymuclectides are useful in gene therapy for treating, inhibiting or preventing neural disorders; immune system disorders (e.g. systemic lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g.

```
nasal vestibulitis, nasal polyps and sinusitis), reproductive disorders, agstrointestinal disorders, pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperproliferative disorders (e.g. Hodgkin's disease and leukaemia), inflammatcry diseases (e.g. septic shock, bursitis and appendicitis), allergic reactions and conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases. Sequences ABUS4914-ABUS5699 and ABUS5748 represent human novel polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        scnmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, and the disorders autoimmune/inflammatory disorders, developmental disorders, endocrine disorders, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conclusions also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence at for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

                             The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A purintelectide of the invention may have a use in gene therappy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine utoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp confections caused by virus, bacteria, fungi or parasite. The dithp collections and also be used in genetic mapping, in identifying individuals committe biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline incention. Note: The sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from NIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                       1;

The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

[a] an oligo-dr primer and an oligonuclectide comprisentary to the
complementary strand of a polymucleotide which comprises one of the 5602
nucleotide sequences defined in the specification, where the
complementary strand of a polymucleotide which comprises one of the 5602
complementary strand of a polymucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polymucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence, where the
coligonucleotide comprises at least 15 nucleotides and the combination of
polymucleotide comprises at least 15 nucleotides and the combination of
coligonucleotide which comprises a selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
gene therapy. The primer sets can be used in antisense therapy and in
gene therapy. The primer sets can be used in antisense therapy and in
gene therapy. The primers are useful for synthesising polynucleotides,
che full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
the full-length without any specialised methods. AAH33133 to AAH3383 and
AAH3833 to AAH3832 represent human anno acid sequences; and AAH3829 to AAH3332 represent
coligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28

                                                             The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTS). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. Parkinson's disease. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                58
                                                                                                                                                                                                                                                                                                                The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:
                                                                                                                                                                                                                                                                                               WIFGRNPACDYHLGNISRLSNKHFQIL--XXXXXXLLNDISTNGTWLNGQKVEKNSNQLL
                                                                                                                                                                                                                                                                      Gaps
An isolated polynucleotide for treating diseases associated with its encoded polypeptide such as cancer and multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; primer; detection; diagnosis; antisense therapy; gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yamamoto J;

complementary strand of a polymucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the comprises an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end comprises and oligonucleotide comprising a sequence complementary to a polynucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence and an oligonucleotide comprises at least 15 nucleotides and the combination of specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in catection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs assily without any specialised methods. mammal. FHARI polynucleotides may also be used as a diagnostic reagent through detection of mutations in the associated gene, and for chromosome localization studies, end tissue expression studies. FHARI antibodies are useful to isolate and to identify clones expressing the polypeptides, or to purify the polypeptides by affinity chromatography and to treat cencer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of human mitotic checkpoint protein Chfr, having a forkhead associated domain (FHA) and a ring finger domain. The protein is required for regulation of the transition of cells from prophase to metaphase during mitosis. It has ubiquitin-protein ligase activity. The Chfr checkpoint was evident in primary human cells, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                Checkpoint with forkhead associated domain and ring finger; Chfr; human; mitosis; cell cycle; tumour; diagnosis; antitumour; drug screening; ubiquitin-protein ligase.
                                                                                                                                                                          28
                                                                                                                                                                                       Novel nucleic acid sequence of mitotic checkpoint gene encoding a checkpoint with forkhead-associated domain and ring finger protein, for diagnosing tumorigenic cells and in screening for anticancer drugs.

c inactivated in 4 of 8 human cancer cell lines. In UZOS cells, a mutation was identified that caused a Val to Met amino acid substitution in the highly conserved C-terminal Cys-rich region of the Chfr protein. In the absence of the Chfr checkpoint, calls subjected to mitotic stress condensed thair chromosomes despite failing to separate their chromosomes Chfr may monitor centrosome separation. Inactivation of the chromosomes. Chfr may monitor centrosome separation. Inactivation of the chromosomes. Chfr may monitor centrosome separation. Inactivation of the chromosomes. Chfr may monitor centrosome separation. Inactivation of the chromosomes. Chfr may monitor centrosome separation. Inactivation of the comprising the present sequence, or sequences comprising at least amino acids 31-103, 303-346 and/or 476-641 of this sequence, are claimed. Claimed methods of determining the tumourigenic potential of a cell comprise examining the cull for the presence of Chfr expression or for the presence of Chfr expression indicating prediaposition to tumourigenesis upon exposure to mitotic stress). A diagnostic kit for detecting the cumourigenic potential of cell cells comprises may comprise a ligand that binds to Chfr, such as an antibody or its fragment. Inhibitors of Chfr are identified by monitoring their effect on Chfr expression, and are used to retard the growth of cancer cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           H1;

                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These ret useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium and corpused in procession vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                              be used to detect inhibitors of cell cycle regulatory factors which can be applied in the development of drugs for treating cancers and proliferative diseases. Cds1 is strongly expressed in the testis as well as other tissues. Cds1 can efficiently phosphorylate cdc25 and histone H1
                                                                                                                                                                                                          47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.

The present sequence represents a M.tuberculosis antigen, TARA10. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are

The present sequence represents a M.tuberculosis antigen, TDRa10. The immunogenic protein, and fusion proteins containing one or more of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or

This polypeptide comprises Mycobacterium tuberculosis soluble antigen This polypeptide comprises Mycobacterium tuberculosis strain H37Rs expression library with rabbit anti-sera raised against M. tuberculosis supernatant. No significant homology was found between TDRa1 and Genebank database sequences. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAM64391-W6439) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis infection vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the above detecting M. tuberculosis of infection in a patient using the above diagnosis of tuberculosis.                                                                                                                                                                                                                                                                                                                                       This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4 GRNPACDYHLGNIS-----RLSNKHFQILXXXXXXLLNDI-STNGTWLNGQKVEKNS
                                                                                                                                                                                                                                                                   New polypeptide comprising antigenic portions of M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mycobacterium tuberculosis; M. tuberculosis; antigen; immunogen; immunotherapy; diagnosis; immunisation; vaccine; infection;

The invention describes a substantially pure immunogenic polypeptide fragment (I) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (1) fusion polypeptide comprising at least one polypeptide fragment (I) and at least one fusion partner; (2) a fusion polypeptide fragment comprising a T-cell epitope from M. tuberculosis protein ESAT-6, or MPT59 and a second different amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis, M. africanum or M. bovis
                                                                                                                                                                                                                                                                                                                                                                                                                                                        4 GRNPACDYHLGNIS-----RLSNKHFQILXXXXXXLLNDI-STNGTWLNGQKVEKNS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                               The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ1929 to AAZ192460 and AAX19083 to AAX19225 are used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GRNPACDYHLGNIS-----RLSNKHFQILXXXXXXXLLNDI-STNGTWLNGQKVEKNS 54

```
are useful as pharmaccuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or bovis. The polypeptides are also useful for diagnosing ongoing or previous sensitization in an animal with bacteria belonging to the tuberculosis complex. The invention also describes the use of CFP7A or response in a mammal, use of CFP7B, CFP19 or MPT59-ESAT6 or a T-cell epitope of for the induction of a strong immune response in a mammal, use of CFP7B, CFP19 or MPT59-ESAT6 or a T-cell epitope of for diagnosis of TB in a mammal by performing a DTH type skin test; use of CFP27, CFP30A, RD1-ORF2, RD1-ORF5, MPT59-ESAT6, ESAT6-MPT59, CFP10A, CFP10A, CFP13, CFP25A, CFP30B, CFP7B or a T-cell epitope of for the preparation of an immunological composition; and for the preparation of a subunit vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of the Mycobacterium tuberculosis (Mtb) strain H37Rv gene Rv1827 product, designated CP17. This is one of 31 immunodominant secreted or cytosolic Mtb proteins of strain H37Rv (see AAM50729-59) discovered through the use of 2-dimensional liquid phase electrophoresis coupled with an in vitro interferon-gamma assay and liquid chromatography-mass spectrometry. The immunogens stimulate a strong interferon-gamma response from T cells of M. tuberculosis infected mice. The invention provides vaccine compositions for boosting immunity to mycobacteria when administered in mid-life to a subject who has been vaccinated neonatally or in early childhood with BCG and in whom
                                                                                                                                                                                                                                                                                                                                                                                                                                                      GRHPDSDIFLDDVTVSRRHAEFRLENVV------DVGSLNGTYVNREPVD--- 127
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 life in a subject who has been vaccinated in childhood with Bacillus
Calmette-Guerrin, has purified proteins from mycobacterium tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine for boosting immunity to mycobacteria when administered in mid-

The present invention describes a method for detecting a cancer cell in a subject, which comprises determining the level of nucleic acid that is subject, which comprises determining the level of nucleic acid or polypeptide is indicative of cancer in the subject. Also product in a sample of the subject, where an elevated level of the concernence of a cancer in a subject comprising a cancer or predicting recurrence of a cancer in a subject comprising a cancer or predicting recurrence of a cancer in a subject comprising a cancer or predicting recurrence of a cancer in a subject comprising a cancer cell; (3) an isolated or protein encoded by a nucleic acid as described above; (2) the isolated or complex; (5) a kit for detecting cancer cell; (3) an isolated or recombinant protein complex; (4) an antibody that binds to the protein complex; (5) a kit for detecting or producing a protein complex; (5) a kit for detecting or producing a protein complex; (5) a kit for detecting or producing a protein complex; (6) a kit for detecting or protein of an EDD polypeptide or a portion of an EDD polypeptide or a portion of an EDD polypeptide or the protein complex; (7) a method for determining a protein protein of the cancing or the portion of an EDD polypeptide; (6) methods for isolating the protein complex; (7) a method for determining a predisposition for disease, or disease state; (8) a method for determining a modulator of the activity, commation; (10) a method for determining a modulator of the level of protein complex; (6) a method for treating a condition associated with celevated expression of EDD protein in a cell; (11) an antisense nucleic acid, ribozyme, PNA, interfering RNA or siRNA, and (12) a pharmaceutical composition comprising the antisense nucleic acid, ribozyme, PNA, interfering RNA or siRNA, EDD has cytostatic activity, and can be used in gene therapy. The methods and modulator are useful for treating a condition associated with EDD over expression such as cancer.
                                                                                                                                                                                                       detection; cancer; 8q22.3; chromosome 8; human; EDD; tumour suppressor; cell cycle modulator; DNA repair; DNA damage; nuclear targeting protein; progesterone receptor; cytostatic; gene therapy; squamous cell carcinoma; hepatocellular carcinoma; ovarian cancer; breast cancer; melanoma; hepatocellular carcinoma; ovarian cancer; breast cancer; melanoma; gastrointestinal cancer; renal cell cancer; bladder cancer; prostate cancer; non-squamous lack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting a cancer cell in a subject sample, also related to cancer treatments, comprises determining the level of nucleic acid that is linked to map position 8q22.3 of the human genome or its expression

breast cancer, melanoma, hepatocellular carcinoma, ovarian cancer, breast cancer, melanoma, head and neck cancer, adenocarcinoma, squamous breast cancer, gastroincestain cancer (eg. gastric, colon, or pancreatic cancer), renal cell cancer, bladder cancer, prostate cancer, non-squamous carcinoma, glioblastoma and medullablastoma. The components and composition are useful for reducing the expression of EDD in a cell to inhibit cellular proliferation. The present sequence represents human chk2 transcript variant 2 protein, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a number of peptides which disrupt the G2 cell cycle checkpoint when administered to a cell. They act by inhibiting Chk2 (the sequence of which is shown here) and Chk1 kinases, and may be derived from Cdc25C. The peptides are useful in the treatment of cell proliferation diseases, such as cancer, as the inhibition of the Chks allows DNA damage and induces apoptosis
                                                                                                                                                                                                                                                                               47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; Cdc25C; Chk1; Chk2; G2 checkpoint; cell cycle regulation; cancer; cell proliferation; apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a novel human checkpoint kinase, termed hCDS1, that acts in coordination with Cdc25 in the DNA damage checkpoint. The sequence is predicted from a CDNA (see AAXS8793) isolated from a SK-N-MC neuroblastoma cDNA library. The predicted protein is 28% identical to the cdc1 protein of S. pombe. A 2.2 kb transcript is expressed in testis and in 8 human cancer samples examined. hCDS1, its inhibitors and activators, are useful for treating cancer or proliferative disease (claimed). Inhibitors and activators of the kinase activity can also be used in anti-cancer therapy, particularly by increasing susceptibility of cancer cells to chemotherapy and/or radiotherapy (claimed). hCDS1 is useful for modifying DNA damage checkpoint activity of a cancer cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    113 W-FGRDKSCEYCFDEPLLKRTDKYRTYSKKHFRIFREVGPKNSYIAYIEDHSGNGTFVNT 171

The present sequence represents hCDS1, a novel human cell cycle checkpoint kinase that acts in coordination with Cdc25 at the DNA damage checkpoint, rather than the replication checkpoint as found in yeast. The hCDS1 sequence was predicted from hCDS1 cDNA (see AAX25464) that was chearing a sequence was predicted from hCDS1 cDNA (see AAX25464) that was cobtained from a human SK-N-MC neuroblastoma cDNA library. It shows 28% contity with cds1 protein of S. pombe, 28% identity to RAD53 and 27% identity to the DWN kinase of S. cerevisiae. Northern blot analysis cidentified a single transcript of about 2.2 kb expressed in testis and in 8 human cancer samples examined. The characterisation of hCDS1 and the clucidation of flar role in the DNA damage checkpoint allows for the clucidation of pharmaceuticals and therapeutic methods for acting as an adjunct to chemotherapy of cancer. Thus, pharmaceutical formulations can this object and the angalant continuous definition and the protein, or other therapeutics identified in caseays of the invention, can be administered in conjunction with any suitable chemotherapy agent to act as an adjunct to the main action of the chemotherapy agent

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human checkpoint kinase 2 (CHK2). The antisense compound specifically hybridises with and inhibits the expression of human CHK2. The antisense compounds are useful as research reagents and diagnostics, in distinguishing between functions of various members of a closical pathway, and in the treatment of a disease or disorder, which can be treated by modulating the expression of CHK2. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                         114 W-FGRDKSCEYCFDEPLLKRTDKYRTYSKKHFRIFREVGPKNSYIAYIEDHSGNGTFVNT 172
                                                                                                                               The present invention provides the protein and coding sequences of a human Chk2 phosphoenzyme inhibitor. The sequences can be used in the chemotherapy of cancers. The present sequence is a protein described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides targeted to a nucleic acid encoding checkpoint kinase 2 (CHK2), useful for treating a disease or condition associated with CHK2, or in distinguishing functions of members of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

Patent No. 5866338

GENERAL INFORMATION:

APPLICANT: Hartwell, Leland H.

APPLICANT: Plon, Sharon B.

APPLICANT: Plon, Sharon B.

TITLE OF INVENTION: Cell Cycle Checkpoint Genes

NUMBER OF SEQUENCES: 19

CORRESPONDENCE ADDRESS:

ADDRESSEE: Christensen O'Connor Johnson Kindness PLLC

STREET: 1420 Fifth Ave., Suite 2800
                                         COMPUTER FELDABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: TBM PC compatible
OPERATIOG SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/198,446B
FILING DATE: 18-FEB-1994
CLASSIFICATION: 536
ATTONEY/AGENT INFORMATION:
NAME: Sheiness, Diama K.
REGISTRATION NUMBER: 35,356
REPERENCE/DOCKET NUMBER: 35,356
REPERENCE/DOCKET NUMBER: 20,356

Patent No. 683447

GENERAL INFORMATION:

APPLICANT: Gldman, Barry S.

APPLICANT: Hinkle, Gregory J.

APPLICANT: Hinkle, Gregory J.

APPLICANT: Wiggand, Roger C.

TITLE OF INVENTION: Myxococcus xanthus Genome Sequences and Uses Thereof FILE REFERENCE: 38-10(15849)B

CURRENT FILING DATE: 2001-07-10

PRIOR APPLICATION NUMBER: 60/217,883

PRIOR FILING DATE: 2000-07-10

PRIOR FILING DATE: 2000-07-10

NUMBER OF SEQ ID NOS: 16825

GREEAL INFORMATION:
APPLICANT: Keith Weinstock et al;
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT PELLE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR PILING DATE: 1998-02-18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                              US-09-949-016-10788

i Sequence 10788, Application US/09949016

i Patent No. 6812339

i GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

ITILE OF INVENTION: POLYNORPHISMS IN KNOWN GENES ASSOCIATED

ITILE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

FILE REFERENCE: CL0001307

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/231,768

PRIOR PLILNG DATE: 2000-10-03

PRIOR PLILNG DATE: 2000-10-03

PRIOR PLILNG DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SEQ ID NOS: 207012

SEQ ID NO 10788
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2, Application US/09529093A

Sequence 20880, Application US/09248796A

Patent No. 6747137

GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

ITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICAN

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.132
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 21, Application US/09919039
Patent No. 6727066
GENERAL INFORMATION:
TITLE OF INVENTION: GENES EXPRESSED IN TREATED HUMAN C3A LIVER CELL CULTURES
TITLE OF INVENTION: GENES EXPRESSED IN TREATED HUMAN C3A LIVER CELL CULTURES
TITLE OF INVENTION: GENES EXPRESSED IN TREATED HUMAN C3A LIVER CELL CULTURES
CURRENT PELICATION NUMBER: US/09/919,039
CURRENT FILING DATE: 2002-09-09
PRIOR APPLICATION NUMBER: 66/222,113
PRIOR PILING DATE: 2000-07-28
NUMBER OF SEC ID NOS: 401

Sequence 56100, Application US/10425114

Sequence 56100, Application US/10425114

Publication No. US20040034888A1

GENERAL INFORMATION:

APPLICANT: Liu, Jingdong

APPLICANT: Screen, Yihua

APPLICANT: Screen, Steven E

APPLICANT: Cao, Yongwei

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With

TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement

TITLE OF INVENTION NUMBER: US/10/425,114

CURRENT FILING DATE: 2003-04-28

NUMBER OF SEQ ID NOS: 73128

SEQ ID NO 56100

LENGTH: 1082
